SUMMARY

Final-year Information Systems student specializing in ML, CV, and GenAI. Experienced in building applied AI systems—including RAG, LangGraph agents, VLM fine-tuning, and supervised ML pipelines. Skilled in Python, PyTorch, FastAPI, Qdrant.

EDUCATION

University of Transport Technology

Bachelor of Information Systems, Faculty of Information Technology

Ha Noi

Expected 2026

- GPA: 3.2/4.0
- Core Coursework: Database Management Systems, Information Systems Design, Data & AI Pipelines.

TECHNICAL SKILLS

Programming & Tools: Python, SQL, Git, Docker, Linux, Pandas, NumPy, Scikit-Learn

Machine Learning & CV: XGBoost, Feature Engineering, SMOTE, PyTorch, Model Fine-tuning

Generative AI: LangChain, LangGraph, RAG Frameworks, Qdrant Vector DB, Supabase PostgreSQL, ReAct Paradigm

Core Strengths: Model optimization, document chunking strategies, system architecture design, logical reasoning

PROJECTS

RagDocument - RAG Document Assistant

[GitHub Link]

- Engineered an end-to-end RAG system using FastAPI and LangGraph for structured private document ingestion.
- Integrated Qdrant vector database, Supabase PostgreSQL, and Jina reranking to optimize hybrid retrieval search.
- Designed custom overlapping chunking strategies to preserve context and reduce retrieval latency during queries.

X-ray Chest Analysis using VLM

[GitHub Link]

- Fine-tuned the Qwen-2.5-7B-VL model to achieve automated visual diagnosis and anomaly detection from medical X-rays.
- Configured vision-language token processing pipelines to directly interpret complex, dense radiographic patterns.
- Optimized inference prompt structures to natively generate detailed analytical text alongside structured medical reports.

ML: Candidate Interview Prediction

[GitHub Link]

- Developed a supervised ML pipeline with XGBoost to predict the probability of candidate technical interview success.
- Executed comprehensive feature engineering on historical candidate metrics and handled extreme class imbalance via SMOTE.
- Conducted hyperparameter optimization to significantly enhance precision and recall scores on validation datasets.

AI Job Application Agent

[GitHub Link]

- Built an autonomous LangChain agent using the ReAct paradigm to execute multi-step profile matching workflows.
- Enabled the agent to parse unstructured job descriptions and dynamically align resume data for targeted formatting.
- Implemented rigorous state tracking, error catching, and infinite-loop prevention within the core orchestrator.

CERTIFICATIONS & LANGUAGES

Certifications: Machine Learning Specialist (Coursera) • SIC AI Certificate (Samsung)

Languages: English: Good technical reading comprehension
